# 1986 Insect Pest Management Guide

# LIVESTOCK and LIVESTOCK BUILDINGS

### CONTENTS

Beef Cattle and Nonlactating	Goats
Dairy Cattle 2	Poultry
Lactating Dairy Cattle 8	Horses
Hogs11	Fly Control in Live
Sheep12	Buildings and Fe
-	

Successful pest management is an essential part of efficient and profitable livestock production. Although pestrelated losses are often inconspicuous, flies, lice, mites, and ticks can cause significant reductions in meat, milk, wool, and egg production. Several livestock pests also transmit important diseases.

Effective management of livestock pests should include the use of cultural, mechanical, and biological control tactics as well as the application of chemical insecticides. Insecticides should be viewed as supplements to, not replacements for, sanitation and sound cultural practices. Used properly, insecticides efficiently reduce pest populations without injuring livestock or threatening the safety of the pesticide applicator or the ultimate consumer of animal products.

This publication provides recommendations for safe and effective use of livestock insecticides. It is revised annually; always use the current year's issue. Registration changes that occur between revisions will be announced to appropriate media sources and county extension offices. If you have questions about the use of insecticides for livestock insect management, consult your county extension adviser.

Selection of the insecticides listed on the following pages was based on EPA registrations and on efficacy data reported by entomologists of the University of Illinois College of Agriculture, the Illinois Natural History Survey, and other midwestern universities. If listed insecticides fail to provide pest control, please contact your county extension adviser or the Entomology Extension office at the University of Illinois.

Additional sources of information. In the tables, leaflets outlining the life history, biology, and habits of livestock pests are indicated by the letters "NHE" and

Goats	13
Poultry	13
Horses	14
Fly Control in Livestock	
Buildings and Feedlots	16

the leaflet number. Request these leaflets at your county extension office or from Entomology Extension, 172 Natural Resources Building, 607 East Peabody Drive, Champaign, Illinois 61820. Additional pest management publications available from the Office of Agricultural Publications (47 Mumford Hall, 1301 West Gregory Drive, Urbana, Illinois 61801) include Circular 899, 1986 Insect Pest Management Guide: Field and Forage Crops; Circular 900, 1986 Insect Pest Management Guide: Home, Yard, and Garden; Circular 925, Insect Pests of Cattle; Circular 897, 1986 Insect Pest Management Guide: Commercial Vegetable Crops and Greenhouse Vegetables; and Circular 1136, Alfalfa Weevil Pest Management Program.

Using livestock insecticides. The pesticide user is always responsible for the results of insecticide applications to his livestock and crops, as well as for problems of pesticide drift and contamination. All users should observe the following rules.

- Read the label and follow directions and safety precautions. Be sure that the insecticide is specifically labeled for the pest and animal in question and the application method planned. THE LABEL IS THE LAW.
- Use face masks or respirators and protective clothing during spraying. Avoid breathing spray mist or dust.
- If pesticides are spilled on the skin or clothing, wash thoroughly with soap and water and change clothes.
- Do not eat, drink, or smoke when handling pesticides.
- Provide adequate ventilation when applying pesticides.
- Do not exceed registered rates of application. Improper or excessive applications can endanger livestock and result in illegal residues in meat and milk.
- Obey the preslaughter interval listed on the label.

- Avoid drift to adjacent cropland, yards, woodlots, lakes, or ponds. Some materials may injure or kill fish, wildlife, and crops.
- Do not treat animals that are sick, overheated, or stressed from shipping, dehorning, castration, recent weaning, and other causes.
- Avoid contamination of feed, mangers, water, milk, and milking equipment.
- Do not spread treated manure on crops that are not listed on the pesticide label.
- Accurately record all pesticide usage. Include the pesticide's trade name, formulation, dilution, application rate, and date of treatment.
- Store pesticides in their original, labeled containers, safely locked away from children, pets, and livestock.
- Dispose of empty pesticide containers promptly and properly according to specified recommendations. Do not breathe smoke from burning containers.
- Contact a physician at once in all cases of suspected poisoning. Symptoms of organophosphate poisoning include blurred vision, abdominal cramps, and tightness in the chest.

Poison Resource Centers. The Poison Resource Centers listed below have been established to provide information about the treatment of poisoning cases. Anyone with a poisoning emergency can call the toll-free telephone number for help. Personnel at the Resource Center will provide first-aid information and refer callers to local treatment centers if necessary.

Poison Resource Centers supplement, but do not replace, local emergency medical services. Do not delay calling local emergency medical personnel to request immediate assistance or transportation. If possible, have the pesticide container and label present when you call or reach a treatment center or hospital.

1753 West Congress Parkway Chicago, Illinois 60612 Telephone: 800-942-5969

Northern and central Illinois 530 N.E. Glen Oak Peoria, Illinois 61603 Telephone: 800-322-5330

Central and southern Illinois 800 East Carpenter Springfield, Illinois 62702 Telephone: 800-252-2022

Preventing livestock poisoning. Every year livestock animals die after consuming pesticide granules, wettable powders, or dusts that have been spilled on trucks, wagons, or soil surfaces. Animals consume the pesticide alone or with feed grains or forage placed on the contaminated surface. Prevent livestock poisoning by properly containing and disposing of spilled pesticides and by storing all pesticides in locked facilities that are inaccessible to domestic and wild animals, as well as to children.

NOTE: The information in the following tables is for educational purposes only. Reference to commercial products or trade names does not constitute an endorsement by the University of Illinois and does not imply discrimination against other similar products. Trade names are presented for reasons of clarity only. The reader is urged to exercise the usual caution in making purchases or evaluating product information.

	Injection	Ivomec 1% (ivermectin)	Ready to use. 1 cc/110 lb body weight.	35 days. Inject subcutaneously. Use aseptic procedures. Do not use on dairy cattle of breeding age.			

Pest	Treatment method	Insecticide and formulation	Dilution and rate	Preslaughter interval, restrictions, comments			
CATTLE GRUBS  Larvae ("grubs") bore through the skin and migrate within the host to the skin of the back. Grubs ruin hides and reduce weight gain. The	Timing of grub control treatments is important. Systemic insecticides applied as pour-ons, spot-ons, or sprays travel within the animal's bloodstream and should be applied to control grubs 6 to 8 weeks before they migrate to the animal's back. Late treatments may cause host-parasite reactions with symptoms of bloat, hindquarter paralysis, or death. Systemic insecticides should be used on native beef cattle herds in August or September in southern Illinois, and in September or October in the northern half of the state. Treat only pastured cattle in herds with histories of grub problems. Animals in confinement are not attacked by ox warble flies (heel flies). Heel fly season and grub treatment dates are earlier for cattle grazed in southern states. Cattle feeders should either know the origin of feeder cattle to determine grub treatment dates or should purchase only cattle that have received grub treatments.  Do not apply systemic insecticides in conjunction with or immediately after phenothiazine, with pyrethrins or synthetic purethroids or their synergists or with other organishes phase insecticides. Do not treat grates under treatment from the parameters of the p						
hairy, yellow and black adult flies, slightly smaller	castration, deho	pyrethroids or their synergists, or with other organophosphate insecticides. Do not treat cattle under stress from castration, dehorning, weaning, shipping, illness, or overexertion. Do not treat calves less than 3 months old.  Pour-on Apply pour-ons using a long-handled dipper supplied by the manufacturer. Apply to the back lines.

Microscopic mites live on the skin or burrow into it. Lesions vary with mite species. Infestations are greatest when cattle are crowded in shelters during winter months.

lesions; lesions usually occur as localized nodules that exude serum. They are most numerous from the tailhead to the hind heels. Insecticides listed previously for louse control on beef cattle also control chorioptic mange mites. Cattle scabies (psoroptic mange) is a quarantinable disease. Its symptoms are lesions that occur first on the withers, over the back, and at the tailhead. Small wounds cause itching, and rubbing leads to abscesses, especially on the shoulders and rump. Mites move to edges of scabs, causing lesions to enlarge and coalesce. Scabs may cover much of the body. Where cattle scabies is detected, contact the Illinois Department of Agriculture, Bureau of Animal Health, Illinois State Fairgrounds, Springfield, Illinois 62706, 217/782-4944.

blood feeders that often attack the lower portion of the front legs. Stable flies attack both pastured and feedlot cattle.		Rabon 97.3% or 7.76% Oral Larvacide (stirofos)	70 mg a.i./100 lb body weight/day.	0 days. Use from May through September. Mix with complete feeds, concentrates, or protein supplements.
	Ear tag or ear tape	Ear tags impregnated with fenvalerate, flucythrinate, or permethrin and permethrin-impregnated ear tapes effectively control horn flies and provide some control of face flies. They do not control stable flies. One tag or tape per cow will effectively control horn flies on cows and calves for up to 20 weeks. Using 2 tags per cow and 2 tags per calf will improve face fly control. Attach tags in late May or early June after fly populations have begun to increase. Remove tags in September or October Combination tags containing permethrin plus chlorpyrifos (Dursban) and a synergist (piperonyl butoxide) also are available; claims regarding their usefulness in controlling pyrethroid-resistant horr flies or delaying resistance development have not been documented. Tags containing the organophosphate Rabon (stirofos) provide fly control for approximately 6 weeks after application.  fenvalerate 8% tag 1-2 tags per head. 0 days. Apply when fly activity begins in spring (Ectrin, Insecta-Shield, Ear Tag Plus, Starbar, Vet Shack)

## **Lactating Dairy Cattle**

Insecticides listed in this section are registered for use on lactating dairy cattle. Most insecticides listed for use on beef cattle can be applied to nonlactating dairy cattle if the specified interval between application and freshening is observed. Follow all label directions.

Pest	Treatment method	Insecticide and formulation	Dilution and rate	Preslaughter interval, restrictions, comments	
LICE (NHE 18) ½ to ½ inch long.	Dust bag			ged and dry, and service at least once per month dusts can be used for direct hand-dusting; follow

# Hogs

Pest	Treatment method	Material and formulation	Dilution and rate	Preslaughter interval, restrictions, comments		
MANGE MITES (AND LICE) Microscopic mites feed on or within skin and cause mange.	Sarcoptic mange can be controlled effectively with the insecticides listed below. Although these insecticides will aid controlling demodectic mange, there is no satisfactory chemical control for the hog follicle mites that cause demodect mange. Prevent sarcoptic mange outbreaks by treating pigs as soon as possible after weaning; treat sows 30-45 da before farrowing; treat boars before the breeding season. Follow label precautions against the use of organophospha sprays, dusts, or pour-ons simultaneously with medications used for internal parasite control. Do not contaminate fee or water. Isolate hogs with demodectic mange. Kill and destroy severely infested animals; market for slaughter than animals that are less severely attacked. Clean and disinfect pens, sheds, etc., before moving in uninfested animals.					
Sarcoptic mange usually starts at the head and then	Spray	Ectiban 5.7% EC (permethrin)	1 qt/25 gal water. Spray animals thoroughly.	5 days. Repeat application after 14 days.		
spreads back; in- fested skin be- comes dry, scurfy, or leathery. Rub-				sifiable concentrates of Insectrin, Permaban, and and mange. Check product labels for dilution		
oing may lead to raw or scabby areas.		Ectrin 10% WDL (fenvalerate)	1 qt/50 gal water. Spray each animal thoroughly.	1 day. Repeat application in 14 days if ne essary.

### FLY CONTROL IN LIVESTOCK BUILDINGS AND FEEDLOTS

Filth fly species that commonly inhabit livestock dwellings, feedlots, and nearby buildings include the house fly, stable fly, little house fly, and several blow fly species. These flies develop in a variety of moist, organic wastes including manure, spilled feed, decaying vegetation, and garbage. Common breeding sites are around feed bunks, at the edges of feeding floors, under fences, along stacks of hay or straw, and in accumulations of manure.

Although stable flies are biting flies that take blood meals from cattle, horses, and hogs, most other flies associated with confined livestock are nuisance pests, not blood-feeders. Neither stable flies nor nonbiting nuisance flies spend much time on their animal hosts, so successful fly control around confined livestock does not center on animal treatments. The use of dust bags, oilers, or ear tags provides little or no control of flies in or around buildings. Sprays directed to the legs and belly of cattle, horses, and hogs (apply as recommended in preceding sections for horn fly control on individual livestock species) may provide short-term relief from stable fly attack, but such applications are not likely to significantly reduce the overall fly problem.

Thorough sanitation practices are almost always necessary for successful fly control. Weekly removal of manure, decaying hay and straw, and spilled feeds disrupts fly breeding sites frequently enough to prevent the development of fly larvae. Removing wastes beneath feeders and along fences is especially important. If manure is temporarily piled before spreading, cover it with black plastic to prevent fly development. If manure is not removed weekly, leaving an 8-inch-thick manure residue at each cleanup may help to maintain populations of insect predators and parasites that limit fly populations. Poultry producers who do not remove manure weekly can maintain predator and parasite populations by removing manure from beneath only one row of cages at each cleanup.

Insecticide applications may be necessary in addition to good sanitation. Unless otherwise indicated, premise treatments listed below can be used in beef, dairy (other than milking rooms), swine, sheep, goat, poultry, and horse facilities. Separate recommendations for fly control in milking rooms are provided.

Pest	Treatment method	Material and formulation	Dilution and rate	Preslaughter interval, restrictions, comments		
HOUSE FLIES, STABLE FLIES, BLOW FLIES, ETC.	Space spray from mist blower or fogger	Space sprays (aerosols) provide rapid control of adult flies present at the time of application. Close doors and windows to reduce air movement during treatment. Daily to twice-weekly applications may be necessary where space sprays are the only treatments used. Animals may be present during application, but space sprays should not be applied directly to livestock. Do not apply space sprays in areas where animals have been treated directly with an insecticide during the previous 24 hours. Do not contaminate feed or water or use in milking rooms.				
		Dibrom 36% EC or 1% Ready-to-use Spray (naled)	1 qt 36% EC/40 gal water. Apply throughout building. Use 1 fl oz of 1% Ready-to-use Spray/ 3,000 cu ft.	0 days.		
		Ectiban 5.7% EC (permethrin)	Misting: Use 4 fl oz/1,000 cu ft.	0 days.		
			Overhead system: 1 qt/12.5 gal fuel or mineral oil; use 4 fl oz/1,000 cu ft.			
		Permectrin II 10% EC (permethrin)	Misting: Use 4 fl oz/1,000 sq ft.	0 days.		
			Overhead system: I qt/12.5 gal fuel or mineral oil; use 4 fl oz/1,000 cu ft.			
		pyrethrins plus synergist	Follow label directions.	0 days.		
		Vapona 23.4% EC (dichlorvos)	Misting: 1 pt/6 gal water; use 1 qt/8,000 cu ft.	0 days.		
			Fogging: 1 pt/3.5 gal diesel oil; use 1 pt/8,000 cu ft.			
		Vapona Feedlot 43.2% EC (dichlorvos)	1 gal/100 gal water. Use 5 gal/acre.	0 days. For cattle feedlots only.		
	Surface residual spray	Surface sprays applied to walls, ceilings, partitions, posts, etc. kill flies at their resting sit residual activity for 1-7 weeks. Products (or the listed concentrations of these products) for use as residual sprays should not be applied directly to animals. Thoroughly spray point of run-off. Do not contaminate feed or water, and do not use residual sprays in				
		Baytex 45% EC (fenthion)	3 qt/25 gal water. Use 1 gal/500 sq ft.	0 days. Residue persists 3-5 weeks.		
		Ciovap 12.5% EC (crotoxyphos plus dichlorvos)	2 gal/25 gal water. Use 1 gal/500 sq ft.	0 days. Do not use in poultry houses. Residue persists 1 week.		
		Cygon 23.4% EC (dimethoate)	1 gal/25 gal water. Use 1-2 gal/1,000 sq ft.	0 days. Remove all animals before spraying. Keep them out for at least 4 hours. Do not use in dairy barns or poultry houses. Residue persists 2-4 weeks.		
		Ectiban 25% WP or 5.7% EC (permethrin) (Atroban, Insectrin, Overtime, Permaban, and Permectrin II are other permethrin products registered for use as surface residual sprays.)	6 oz 25% WP/11 gal water or 1 qt 5.7% EC/12.5 gal water. Use 1 gal/750 sq ft.	0 days. Residue persists 3-7 weeks.		
		Ectrin 10% WDL (fenvalerate)	1 qt/10 gal water. Use 1 gal/750 sq ft.	0 days for swine buildings. Use only in swine buildings and in horse barns where horses are not to be slaughtered. Residue persists 3-7 weeks.		
		Rabon 50% WP (stirofos)	4-8 lb/25 gal water. Use 1-2 gal/1,000 sq ft.	0 days. Residue persists 2-4 weeks.		

Fly Control, continued

Pest	Treatment method	Material and formulation	Dilution and rate	Preslaughter interval, restrictions, comments		
HOUSE FLIES, STABLE FLIES, BLOW FLIES, ETC., cont.	Bait	Baits may enhance house fly control; they do not attract stable flies. Bait applications of insecticides used in surface residual sprays can be prepared by adding sugar or corn syrup to the spray tank mixture. Follow directions on individual product labels. Dry baits can be sprinkled in areas where flies congregate. Do not place dry baits in areas where birds or animals will contact the bait. Do not contaminate feed or water.				
		Dipterex 1% Dry Bait (trichlorfon)	4 oz/1,000 sq ft.	0 days.		
		Golden Malrin 1% Dry Bait (methomyl)	4 oz/1,000 sq ft.	0 days.		
		Vapona 0.5% Dry Bait (dichlorvos)	4 oz/1,000 sq ft.	0 days.		
	Resin strip	Farm Strip 20% resin strip (dichlorvos)	Suspend 1 strip/ 1,000 cu ft.	0 days. Close doors and windows so that vapor concentrations reach recommended levels. Do not hang near light bulbs or within reach of animals.		
	Manure spray	Manure sprays control fly larvae that are developing in treated feces. Migration of adult flies nearby areas can occur if any breeding sites remain untreated. Manure sprays are recommende where manure cannot be removed on a weekly basis. Apply sprays at rates that wet the m surface; soaking is not necessary. Repeat applications as necessary, but not more often than edays. Do not apply where mammals or birds will come in contact with the manure. Do not treated manure to crops not listed on the insecticide label.				
		Cygon 23.4% EC (dimethoate)	0.5 pt/5 qt water. Apply as a coarse spray.	0 days.		
		Rabon 50% WP or 24% EC (stirofos)	4 lb 50% WP or 1 gal 24% EC/25 gal water. Use 1 gal/100 sq ft. manure.	0 days.		
		Ravap 28.7% EC (stirofos plus dichlorvos)	1 gal/25 gal water. Use 1 gal/100 sq ft manure.	0 days.		
		Vapona 23.4% EC (dichlorvos)	1 gal/25 gal water. Use 1-2 qt/100 sq ft manure.	0 days.		
	Feed additive	Feed additives used to prevent the development of fly larvae in feces provide minimal control of flie in livestock buildings. Feed additives do not reach house fly and stable fly larvae that develop in site other than fresh manure. Good sanitation more effectively prohibits larval development. Anima must consistently consume recommended dosages for feed additives to be effective against fly larva in manure.				
		Moorman's 0.02% IGR (methoprene)	0.25-0.5 lb/100 lb body weight/animal/month.	0 days. Feed mineral mix or block from May through September. Beef cattle and dairy cat- tle only.		
		Rabon 7.76% or 97.3% Oral Larvacide (stirofos)	70 mg a.i./100 lb body weight/day.	0 days. Use from May through September. Mix with complete feeds, concentrates, or protein supplements. For beef cattle, dairy cattle, and hogs only.		
	Biological agents	Several companies sell parasitic wasps for use in controlling flies around livestock build feedlots. These predaceous wasps attack only flies; they do not sting (or bite) other insects, or humans. Adult wasps (less than 1/10-inch long) deposit eggs on or inside fly larvae of Developing wasps kill the immature flies. Suppliers usually recommend wasp releases (several wasps per release) before and during the fly season.				
		ge flies around livestock facilities, frequent and oval, water management, and weed control) must tain insecticide applications to supplement the ances it is difficult to assess the separate impacts e applications. Although wasp releases have been try housing, research data do not support other is. If biological control agents are to significantly the sanitation and chemical control practices is

Pest	Treatment method	Material and formulation	Dilution and rate	Preslaughter interval, restrictions, comments			
CONTROL OF FLIES IN		Although effective fly control is essential in dairy barns and milkrooms, small amounts of pesticides can be detected in milk, and their presence is often illegal. To control flies and avoid residue problems, the following steps are recommended:					
MILKING ROOMS	1. Use good sanitation and recommended insecticides in dairy barns to reduce the number of flies entering the milkroom.						
	2. Use sticky fly strips where appropriate.						
	3. Use tight screens (14-16 mesh) on milkroom doors and windows. Copper, aluminum, bronze, plastic, or rust-resisting screens are best.						
	4. Dichlorvos resin strips will give excellent control if windows and doors are kept closed when one strip per 1,000 cubic feet of space is used. Replace strips when they become ineffective.						
	5. Use a mist or aerosol spray of 0.06-0.1% pyrethrin plus piperonyl butoxide oil-based fly sprays in the milkroom when resin strips do not give adequate fly control. To prevent milk contamination, cover all milking utensils, cans, bulk tanks, and containers before spraying.						
RATTAILED	The rattailed maggot is the larval stage of a syrphid fly. The 1¼-inch long maggot has a cylindrical body about ¾-inch						

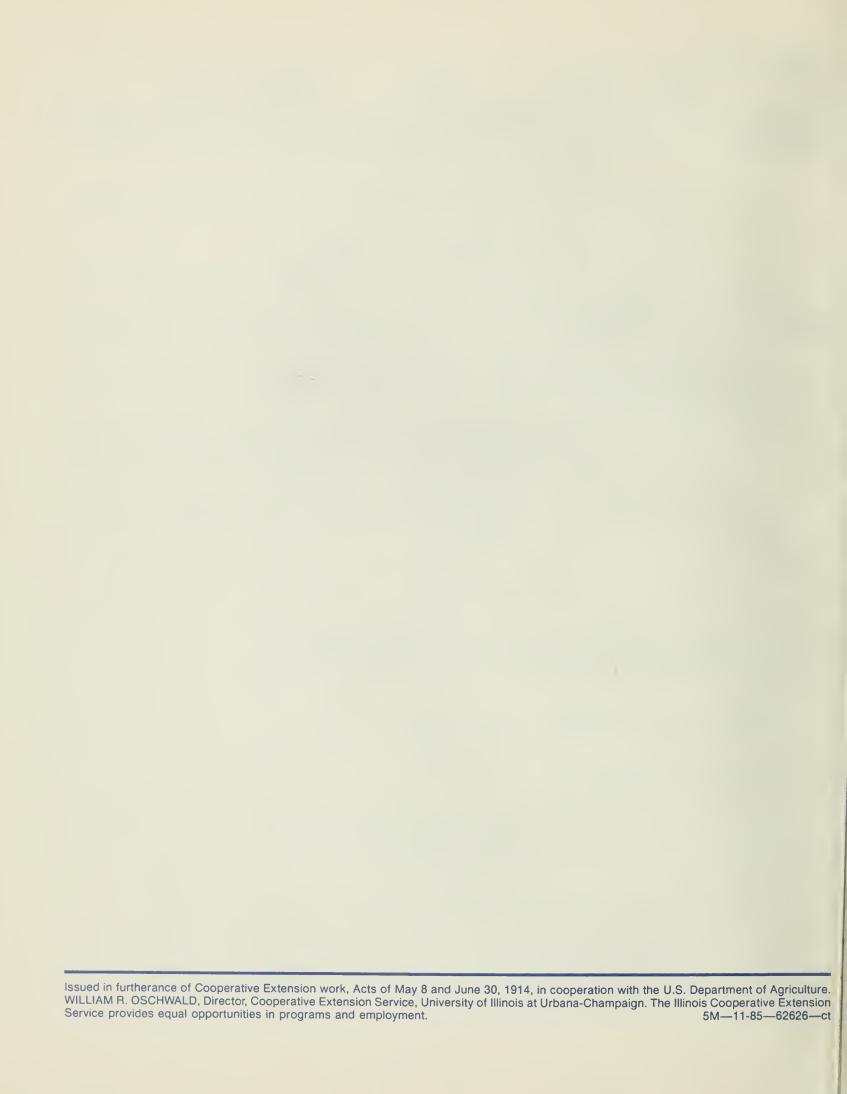

### **MAGGOTS**

long and a tail-like breathing tube that extends 1/2-inch from the posterior of the body. The adult fly is a bee-like hover fly that is not a pest on or around livestock or humans.

Rattailed maggots live in highly polluted water such as that in livestock lagoons and manure pits. When larvae are ready to pupate, they migrate from lagoons and pits to adjacent, drier areas. They become pests when they enter feed, egg cartons, and milking rooms.

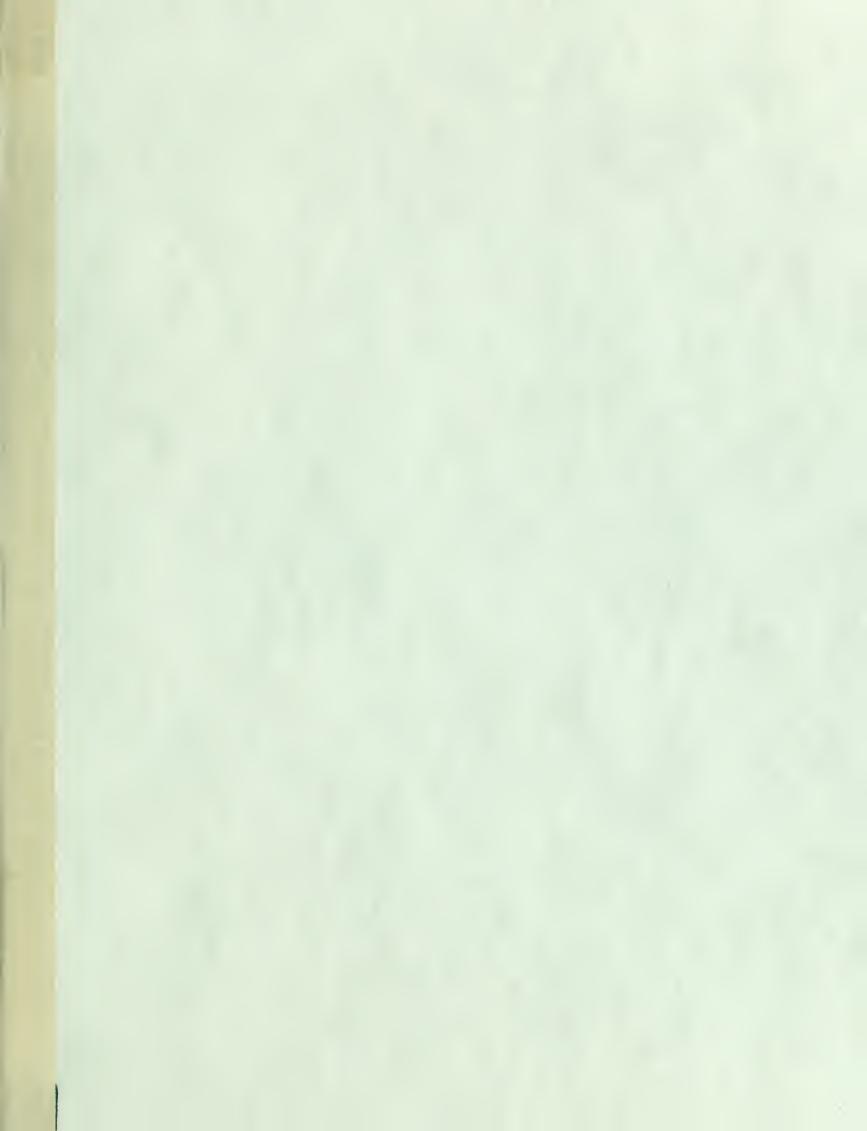

To limit rattailed maggot development, eliminate floating solids within pits and keep pit sidewalls clean. Agitate the pit contents or pump the pit weekly. Although insecticides are of limited value in managing rattailed maggots, application of Ravap to the pit surface provides some control. Use 1 pint Ravap 28.7% EC per 3½ gallons fuel oil and apply 1 gallon of the spray mixture per 100 square feet of pit surface. (Do not agitate the pit contents after application.) Repeat applications as needed, but not more often than every 7 days.

Limit rattailed maggot migration by constructing a soil barrier between the pit and the milking room. Migrating larvae will burrow into the loose soil to pupate instead of continuing their migration into milking rooms, etc.
